PROFILE SUMMARY

Python developer and 2026 CSE graduate with hands-on experience building automation pipelines, AI-integrated applications, and backend services across production and personal projects. Proficient in writing clean, maintainable Python across data processing, NLP, API integration, and scripting workflows. Completed a six-month SDE internship at CaratLane (Tata), where I used Python to build internal automation tools, performed root-cause analysis on live system failures, and collaborated within an agile engineering team. Comfortable with version control, software testing, and debugging across the full development lifecycle.

WORK EXPERIENCE

SDE Intern | CaratLane — A Tata Product

Dec 2025 – Jun 2026

Tech Stack: *Python, TypeScript, Ruby, SQL, SMTP, Git*

- Built an internal Python automation tool that queries order and invoice data from the backend database via SQL and dispatches structured reports to a Google Chat channel and email recipients over SMTP — eliminating manual reporting effort for the operations team.
- Performed root-cause analysis on a critical invoice-sync failure in the SaaS platform — traced the defect to missing business logic in the invoice-push service, implemented and tested the fix, and restored accurate data flow across the system.
- Developed the District Payment feature end-to-end in the customer-facing store application, integrating the payment flow across backend services in TypeScript and Ruby.
- Participated in structured code reviews within an agile team — improved code quality and logic density per review cycle, consistently reducing function verbosity and aligning with team coding standards.
- Collaborated cross-functionally with backend engineers, operations, and product stakeholders to triage issues, validate fixes, and deliver features on a live production codebase using Git-based version control workflows.

Software Web Development Intern | Exposys Data Labs

Jun 2025 – Oct 2025

Tech Stack: *React, Node.js, JavaScript, Git*

- Developed and maintained responsive web application features using React and Node.js within a collaborative team, following agile development practices.
- Improved codebase quality by refactoring modules for readability, performance, and modularity — participated in code reviews and adhered to team engineering standards.

PROJECTS

B.I.R.D. — Business Intelligence & Resource Development

Jul 2025 – Present

Tech Stack: *Python, OpenAI API, Google API, MySQL, NLP, Vercel*

- Designed and deployed a full-stack Python-based AI platform that connects startups with venture capitalists — live on Vercel with active users, built to scale across multiple roles and data volumes.
- Developed a rule-based weighted scoring engine in Python that evaluates startup profiles across structured dimensions, producing automated investor-readiness assessments.
- Integrated OpenAI and Google APIs to build a chatbot that guides user onboarding and role selection — implemented clean, modular Python code with clearly separated business logic layers.
- Designed MySQL schema with role-based access control and scoring audit trails — maintained full documentation for data flow and system logic.

AI Resume Screener

Mar 2025 – Apr 2025

Tech Stack: *Python, BERT, Scikit-learn, Pandas, NLP*

- Built a Python-based resume parsing and ranking pipeline using BERT semantic embeddings to automatically match and score candidate profiles against job descriptions.
- Implemented a Scikit-learn scoring algorithm that outputs ranked shortlists by skill-match percentage — designed with clean, testable Python functions and a modular pipeline structure.
- Developed a Pandas preprocessing pipeline to normalize and clean raw resume text inputs — ensuring consistent, high-quality data before scoring.

Mail Dispatcher

Aug 2025 – Sep 2025

Tech Stack: *JavaScript, HTML, CSS, SMTP*

- Built a bulk email dispatch system for up to 1,000 recipients — implemented scheduling logic, server-side email validation, and a structured dispatch queue for reliable, scalable delivery.
- Designed configurable content and recipient workflows demonstrating focus on reliability, clean code structure, and automation.

EDUCATION

B.Tech — Computer Science Engineering

2022 – 2026

Manakula Vinayagar Institute of Technology, Pondicherry University **| CGPA: 8.32 / 10 (till Semester VII)**

TECHNICAL SKILLS

Primary Language: Python (automation, NLP, ML pipelines, API integration, scripting)
Other Languages: TypeScript, Ruby, JavaScript, SQL, Java, C, C++
Python Libraries: Pandas, NumPy, Scikit-learn, Matplotlib, BERT / Transformers
AI / ML: OpenAI API, Google AI API, NLP, Weighted Scoring Systems
Web & Backend: React, Node.js, Express, REST APIs, SMTP Integration
Databases: MySQL, PostgreSQL (schema design, query optimization)
Tools & Practices: Git, GitHub, Vercel, VS Code, Agile, SDLC, Code Review, Debugging, RCA

ACHIEVEMENTS & RESEARCH

- Published Scopus-indexed conference paper: "AI-Driven Carbon Capture and Utilisation: Advancing Sustainable Solutions For Climate Change Mitigation" — received special appreciation.
- Published and received appreciation for research paper: "Transition Mechanism of IPv6 to IPv4" at the same Scopus-indexed conference.
- Participant — Smart India Hackathon, Yi-Innovation Hackathon, Unisys Hackathon.
- Attended AI & LLM workshop at NIT Puducherry and Cyber Security workshop at IIT Madras.

CERTIFICATIONS

- Google Cybersecurity Certificate — Coursera
- Cybersecurity Certificate — Forage
- Python & C Programming — Edusphere
- UI/UX Design — VEI Technologies
- HTML/CSS — freeCodeCamp (Datanerdz.ai)
